WoW Client or World of Warcraft is a massively multiplayer online role-playing game (MMORPG) created by Blizzard Entertainment. The game is set primarily on a fantasy world called Azeroth, and is designed to connect players across real-time and local multiplayer games over the internet, through dedicated servers, and through the use of client software to control their characters. This lets a single person play across a variety of different computers and operating systems, and allows for people who are not at the same location to coordinate their group activities. The game was released in North America and Europe on August 23, 2004. Originally designed as an expansion pack for the multiplayer first-person shooter game Diablo II, it is also available as a stand-alone game under the title Warcraft III: Reign of Chaos. After its initial release, it was followed by two expansions and a standalone expansion called Warcraft III: The Frozen Throne. The player character is introduced through a traditional quest-based story. The player is guided through the game by one of six playable races, each with its own unique main character and specializations. Each player has access to a starting town, a single character to play, a variety of skills, and generally a set of default settings that are easier to understand. The game also features a player-made auction house where players can buy or sell game time, in-game items, and characters. The game was nominated for an Outstanding Achievement in Original Interactive Media Award in 2005, and has sold over 40 million copies worldwide. The base-game began as a standalone expansion that was released as part of a compilation package containing Diablo II, Diablo II: Lord of Destruction, and the expansion Diablo II: Hellfire. It was then released as a standalone game in June 2005. World of Warcraft was nominated for the 2006 Game of the Year, New Game of the Year, Action Game of the Year, and Puzzle Game of the Year awards.
